Pomona's transportation 2030 goals help give background to the motivations for this project. Since faculty and staff commutes account for 23% of overall transportation emissions in 2026, focusing on the specifics of faculty and staff commute patterns is important to identify potential reductions. The dashboard will use the 2026 commute data to show how travel modes and estimated emissions vary across the regions where employees live.

To explore alternatives to driving, I will integrate General Transit Feed Specification (GTFS) schedule data from Metrolink and Foothill Transit since these two transit companies primarily serve Pomona's campus. These feeds have schedules, routings, and show where stops are located. Similarly, OpenTripPlanner has transit schedules and walking routes which demonstrate what trips are available from a selected ZIP code which an employee lives in. The dashboard can demonstrate travel time, walking distance, and transit connections. Since the dataset has ZIP codes, the trips would likely represent possible options for a generalized area rather than individualized recommendations.
